# STRONG CONVERGENCE OF A HYBRID ITERATION FOR GENERALIZED MIXED EQUILIBRIUM PROBLEM AND BREGMAN TOTALLY QUASI-ASYMPTOTICALLY NONEXPANSIVE MAPPING IN BANACH SPACES <br> Nguyen Trung Hieu <br> Department of Mathematics and Information Technology Teacher Education, Dong Thap University, Cao Lanh City, Dong Thap Province, Viet Nam <br> *Corresponding author: Nguyen Trung Hieu, Email: ngtrunghieu@dthu.edu.vn <br> Received: June 20, 2021; Revised: August 20, 2021; Accepted: September, 2021 

#### Abstract

The purpose of this paper is to combine the Bregman distance with the shrinking projection method to introduce a new hybrid iteration process for a generalized mixed equilibrium problem and a Bregman totally quasi-asymptotically nonexpansive mapping. After that, under some suitable conditions, we prove that the proposed iteration strongly converges to the Bregman projection of the initial point onto common element set of the solution set of a generalized mixed equilibrium problem and the fixed point set of a Bregman totally quasi-asymptotically nonexpansive mapping in reflexive Banach spaces. This theorem extends and improves the results in (Alizadeh \& Moradlou, 2016) from a generalized hybrid mapping and an equilibrium problem in Hilbert spaces to a Bregman totally quasi-asymptotically nonexpansive mapping and a generalized mixed equilibrium problem in reflexive Banach spaces. The obtained result is applied to a generalized mixed equilibrium problem and a Bregman quasi-asymptotically nonexpansive mapping in reflexive Banach spaces. In addition, an example is provided to illustrate for the proposed iteration process.

Keywords: Bregman totally quasi-asymptotically nonexpansive mapping; generalized mixed equilibrium problem; hybrid iteration process; reflexive Banach spaces

## 1. Introduction and preliminaries

Suppose that $X$ is a real reflexive Banach space, $\Omega$ is a nonempty, closed and convex subset of $X, X^{*}$ is a the dual space of $X$. Let $f: \Omega \times \Omega \rightarrow \mathbb{R}, \varphi: \Omega \rightarrow \mathbb{R}$ be two function and $\psi: \Omega \rightarrow X^{*}$ be a mapping. We denote the value of $u^{*} \in X^{*}$ at $u \in X$ by $\left\langle u^{*}, u\right\rangle$. The generalized mixed equilibrium problem (GMEP) is to find $u \in \Omega$ such that $f(u, v)+\langle\psi(u), v-u\rangle+\varphi(v) \geq \varphi(u)$ for all $v \in \Omega$. The set of solutions of (GMEP) is denoted by $\operatorname{GMEP}(f, \varphi, \psi)=\{u \in \Omega: f(u, v)+\langle\psi(u), v-u\rangle+\varphi(v) \geq \varphi(u), \forall v \in \Omega\}$. Note that, if $\varphi \equiv 0$ and $\psi \equiv 0$, the problem (GMEP) is reduced into the equilibrium problem (EP) which is to find $u \in \Omega$ such that $f(u, v) \geq 0$ for all $v \in \Omega$.

In recent times, there were many methods for solving the above problems. In 2016, Darvish introduced an iterative method for finding common elements of the solutions set of the problem (GMEP) and the fixed points set of a Bregman strongly nonexpansive mapping in reflexive Banach spaces. In 2016, Zhu and Huang introduced a new hybrid iterative scheme for finding common solutions of the problem (EP) and fixed points of Bregman totally quasi-asymptotically nonexpansive mappings. In 2018, Ni and Wen proposed a new iterative scheme for finding a common solution of a system of the problem (GMEP) and fixed points of a finite family of Bregman totally quasi-asymptotically nonexpansive mappings. Note that these convergence results extend and improve the existing results from Hilbert spaces or smooth Banach spaces to reflexive Banach spaces. Therefore, an interesting work naturally raised is to continue to generalize the existing convergence results from Hilbert spaces to reflexive Banach spaces.

In this paper, motivated by the iteration process in (Alizadeh \&Moradlou, 2016), we introduce a new hybrid iterative scheme which is to find common elements of the set of solutions of the problem (GMEP) and the set of fixed points of Bregman totally quasiasymptotically nonexpansive mappings. After that, we prove a strong convergence theorem for the proposed iteration in reflexive Banach spaces. In addition, we give a numerical example to illustrate the obtained results.

Now, we recall some notions and results which will be useful in what follows.
Assume that $g: X \rightarrow(-\infty,+\infty]$ is a lower semi-continuous, convex and proper function. We denote the domain of $g$ by $\operatorname{dom} g=\{u \in X: g(u)<+\infty\}$. For any $u \in \operatorname{int}(\operatorname{dom} g)$ and $v \in X$, we denote by $g^{\prime}(u, v)=\lim _{\lambda \rightarrow 0^{+}} \frac{g(u+\lambda v)-g(u)}{\lambda}$ (1.1) the righthand derivative of $g$ at $u$ in the direction $v$. The function $g$ is called Gâteaux differentiable at $u$ if the limit (1.1) exists for all $v$. Then the gradient of $g$ at $u$ is $\nabla g(u)$, which is defined by $\langle\nabla g(u), v\rangle=g^{\prime}(u, v)$ for all $v \in X$. The function $g$ is called Fréchet differentiable at $u$ if the limit (1.1) is attained uniformly in $\|v\|=1$. The function $g$ is called be uniformly Fréchet differentiable on a subset $\Omega$ of $X$ if the limit (1.1) is attained uniformly for $u \in \Omega$ and $\|v\|=1$.

Note that if $g$ is uniformly Fréchet differentiable, then $g$ is uniformly continuous (see [Ambrosetti \& Prodi, 1993, Theorem 1.8]). If $g$ is Gâteaux differentiable and lower semicontinuous convex, then $g$ is bounded on bounded sets if and only if $\nabla g$ is bounded on bounded sets (see [Ambrosetti \& Prodi, 1993, Proposition 1.1.11]). Furthermore, if $g$ is uniformly Fréchet differentiable and bounded on bounded subsets, then $\nabla g$ is uniformly continuous on bounded subsets of $X^{*}$ (see [Reich \& Sabach, 2009, Proposition 1]).

Let $u \in \operatorname{int}(\operatorname{dom} g)$, the Fenchel conjugate of $g$ is the function $g^{*}: X^{*} \rightarrow(-\infty,+\infty]$ defined by $g^{*}\left(u^{*}\right)=\sup \left\{\left\langle u^{*}, u\right\rangle-g(u): u \in X\right\}$ for all $u^{*} \in X^{*}$.

Definition 1.1 [Chang et al., 2014, Definition 2.2]. Let $X$ be a real reflexive Banach space and $g: X \rightarrow(-\infty,+\infty]$ be a function. Then $g$ is called Legendre if
(L1) $\operatorname{int}(\operatorname{dom} g) \neq \varnothing, g$ is Gâteaux differentiable on $\operatorname{int}(\operatorname{dom} g)$ and $\operatorname{dom}(\nabla g)=\operatorname{int}(\operatorname{dom} g)$.
(L2) $\operatorname{int}\left(\operatorname{dom} g^{*}\right) \neq \varnothing, g^{*}$ is Gâteaux differentiable on $\operatorname{int}\left(\operatorname{dom} g^{*}\right)$ and $\operatorname{dom}\left(\nabla g^{*}\right)=\operatorname{int}\left(\operatorname{dom} g^{*}\right)$.
Remark 1.2. [Chang et al., 2014, Remark 2.3]. Let $X$ be a real reflexive Banach space and $g: E \rightarrow(-\infty,+\infty]$ be Legendre. Then
(1) $g$ is Legendre if and only if $g^{*}$ is Legendre.
(2) $\nabla g=\left(\nabla g^{*}\right)^{-1}, \operatorname{ran}(\nabla g)=\operatorname{dom}\left(\nabla g^{*}\right)$ and $\operatorname{ran}\left(\nabla g^{*}\right)=\operatorname{dom}(\nabla g)=\operatorname{int}(\operatorname{dom} g)$, where $\operatorname{ran}(\nabla g)$ is the range of $\nabla g$.
Definition 1.3. [Censor \& Lent, 1981, p.324]. Let $X$ be a real reflexive Banach space and $g: X \rightarrow(-\infty,+\infty]$ be Gâteaux differentiable. Then $D_{g}: \operatorname{dom} g \times \operatorname{int}(\operatorname{dom} g) \rightarrow[0, \infty)$, defined by $D_{g}(u, v)=g(u)-g(v)-\langle\nabla g(v), u-v\rangle$ is called the Bregman distance with respect to $g$.

From the definition, we have $D_{g}(u, v)+D_{g}(v, w)-D_{g}(u, w)=\langle\nabla g(w)-\nabla g(v), u-v\rangle$ for all $u \in \operatorname{dom} g$ and $v, w \in \operatorname{int}(\operatorname{dom} g)$.

Let $g: X \rightarrow(-\infty,+\infty]$ be Gâteaux differentiable and $V_{g}: X \times X^{*} \rightarrow[0, \infty)$ be defined by $V_{g}\left(u, u^{*}\right)=g(u)-\left\langle u^{*}, u\right\rangle+g^{*}\left(u^{*}\right)$ for all $u \in X$ and $u^{*} \in X^{*}$.
Remark 1.4. Let $g: X \rightarrow(-\infty,+\infty]$ be a Gâteaux differentiable function. Then
(1) [Kohsaka \& Takahashi, 2005, Lemma 3.2] For any $u \in X$ and $u^{*} \in X^{*}$, we have $V_{g}\left(u, u^{*}\right)=D_{g}\left(u, \nabla g^{*}\left(u^{*}\right)\right)$.
(2) [Kumam et al., 2016, p.7] $V_{f}$ is convex in the second variable. Furthermore, for any $u \in \operatorname{dom} g,\left\{u_{k}\right\}_{k=1}^{m} \subset \operatorname{int}(\operatorname{dom} g)$ and $\left\{t_{k}\right\}_{k=1}^{m} \subset[0,1]$ with $\sum_{k=1}^{m} t_{k}=1$, we have

$$
D_{g}\left(u, \nabla g^{*}\left(\sum_{k=1}^{m} t_{k} \nabla g\left(u_{k}\right)\right)\right) \leq \sum_{k=1}^{m} t_{k} D_{g}\left(u, u_{k}\right) .
$$

Definition 1.5. [Butnariu \& Iusem, 2000, p.69]. Let $X$ be a real reflexive Banach space, $g: X \rightarrow(-\infty,+\infty]$ be Legendre and $\Omega$ be a nonempty, convex and closed subset of $\operatorname{int}(\operatorname{dom} g)$. The Bregman projection of $u \in \operatorname{int}(\operatorname{dom} g)$ onto $\Omega$ is the unique vector $P_{\Omega}^{g}(u) \in \Omega$ statisfying $D_{g}\left(P_{\Omega}^{g}(u), u\right)=\inf \left\{D_{g}(v, u): v \in \Omega\right\}$.
Definition 1.6. [Resmerita, 2004, p.1]. Let $X$ be a real reflexive Banach space and $g: X \rightarrow(-\infty,+\infty]$ be Gâteaux differentiable. Then
(1) $g$ is called totally convex at $u \in \operatorname{int}(\operatorname{domg})$ if any $\varepsilon>0$, we have

$$
v_{g}(u, \varepsilon)=\inf \left\{D_{g}(v, u): y \in \operatorname{dom} g,\|v-u\|=\varepsilon\right\}>0 .
$$

(2) $g$ is called totally convex if $g$ is totally convex at every point $u \in \operatorname{int}(\operatorname{dom} f)$.
(3) $g$ is called totally convex on bounded subsets of $X$ if any nonempty bounded subset $E$ of $X$ and $t>0$, we have $v_{g}(E, \varepsilon)=\inf \left\{v_{g}(u, \varepsilon): u \in E \cap \operatorname{dom} g\right\}>0$.
Proposition 1.7. [Resmerita, 2004, Proposition 2.2]. Let $X$ be a real reflexive Banach space, and $g: X \rightarrow \mathbb{R}$ be Gâteaux differentiable. Then $g$ is totally convex at $u \in X$ if and only if for any sequense $\left\{v_{n}\right\} \subset X$ such that $\lim _{n \rightarrow \infty} D_{g}\left(v_{n}, u\right)=0$, we have $\lim _{n \rightarrow \infty}\left\|v_{n}-u\right\|=0$.
Proposition 1.8. [Butnariu \& Iusem, 2000, Lemma 2.1.2]. Let $X$ be a real reflexive Banach space, and $g: X \rightarrow \mathbb{R}$ be convex and Gâteaux differentiable. Then $g$ is totally convex on bounded sets if and only if for any sequence $\left\{u_{n}\right\},\left\{v_{n}\right\} \subset X$ such that $\left\{u_{n}\right\}$ is bounded and $\lim _{n \rightarrow \infty} D_{g}\left(v_{n}, u_{n}\right)=0$, we have $\lim _{n \rightarrow \infty}\left\|v_{n}-u_{n}\right\|=0$.
Proposition 1.9. [Butnariu \& Resmerita, 2006, Corollary 4.4]. Let $X$ be a real reflexive Banach space, $g: X \rightarrow(-\infty,+\infty]$ be a Gâteaux differentiable function and totally convex on $\operatorname{int}(\operatorname{domg}), \Omega$ be a nonempty, closed and convex subset and $u \in \operatorname{int}(\operatorname{domg})$. Then
(1) $w=P_{\Omega}^{g}(u)$ if and only if $\langle\nabla g(u)-\nabla g(w), w-v\rangle \geq 0$ for all $v \in \Omega$.
(2) $D_{g}\left(v, P_{\Omega}^{g}(u)\right)+D_{g}\left(P_{\Omega}^{g}(u), u\right) \leq D_{g}(v, u)$ for all $v \in \Omega$.

Proposition 1.10. Let $X$ be a real reflexive Banach space and $g: X \rightarrow \mathbb{R}$ be a function.
(1) [Reich \& Sabach, 2010, Lemma 1]. If $g$ is Gâteaux differentiable and totally convex on $X, u \in X$ and $\left\{u_{n}\right\} \subset X$ satisfying $\left\{D_{g}\left(u_{n}, u\right)\right\}$ is bounded, then the sequence $\left\{u_{n}\right\}$ is bounded.
(2) [Sabach, 2011, Proposition 2.3]. If $g$ is Legendre such that $\nabla g^{*}$ is bounded on bounded subsets, $u \in X$ and $\left\{u_{n}\right\} \subset X$ satisfying $\left\{D_{g}\left(u, u_{n}\right)\right\}$ is bounded, then the sequence $\left\{u_{n}\right\}$ is bounded.
Definition 1.11. [Zalinescu, 2002, p.203, p.207, p.221]. Let $X$ be a Banach space. We denote by $S_{1}=\{u \in X:\|u\|<1\}$ and $B_{\varepsilon}=\{u \in X:\|u\| \leq \varepsilon\}$ for some $\varepsilon>0$. Then
(1) $g: X \rightarrow \mathbb{R}$ is called uniformly convex on bounded subsets if $\rho_{\varepsilon}(\lambda)>0$ for all $\lambda, \varepsilon>0$, where the function $\rho_{\varepsilon}:[0, \infty) \rightarrow[0, \infty)$ is defined by

$$
\rho_{\varepsilon}(\lambda)=\inf _{u, v \in B_{\varepsilon} \| u-v \mid=\lambda, \delta(0,1)} \frac{\delta g(u)+(1-\delta) g(v)-g(\delta u+(1-\delta) v)}{\delta(1-\delta)} .
$$

(2) $g: X \rightarrow \mathbb{R}$ is called uniformly smooth on bounded subsets if $\lim _{\lambda \rightarrow 0} \frac{\sigma_{\varepsilon}(\lambda)}{\lambda}=0$ for all $\varepsilon>0$, where the function $\sigma_{\varepsilon}:[0, \infty) \rightarrow[0, \infty)$ is defined by

$$
\sigma_{\varepsilon}(\lambda)=\sup _{u \in B_{\varepsilon} v \in S_{1}, \delta \in(0,1)} \frac{\delta g(u+(1-\delta) \lambda v)+(1-\delta) g(u-\delta \lambda v)-g(u)}{\delta(1-\delta)} .
$$

Remark 1.12. [Naraghirad \& Yao, 2013, p.7]. The function $g$ is uniformly convex on bounded subsets if and only if $g$ is totally convex on bounded subsets.
Definition 1.13. [Kohsaka and Takahashi, 2005, p.509]. Let $X$ be a Banach space. Then $g: X \rightarrow(-\infty,+\infty]$ is called strongly coercive if $\lim _{\|u\| \rightarrow+\infty} \frac{g(u)}{\|u\|}=+\infty$.
Proposition 1.14. [Zalinescu, 2002, Proposition 3.6.3]. Let $X$ be a real reflexive Banach space, $g: X \rightarrow \mathbb{R}$ be strongly coercive, continuous and convex. Then $g$ is bounded on bounded subsets and uniformly smooth on bounded subsets if and only if $\operatorname{dom}\left(g^{*}\right)=X^{*}$, $g^{*}$ is strongly coercive and uniformly convex on bounded subsets.
Proposition 1.15. [Zalinescu, 2002, Proposition 3.6.4]. Let $X$ be a real reflexive Banach space, $g: X \rightarrow \mathbb{R}$ be convex, continuous and bounded on bounded subsets of $X$. Then the following statements are equivalent.
(1) $g$ is uniformly convex on bounded subsets and strongly coercive.
(2) $\operatorname{Dom}\left(g^{*}\right)=X^{*}, g^{*}$ is bounded and uniformly smooth on bounded subsets.
(3) $\operatorname{Dom}\left(g^{*}\right)=X^{*}, g^{*}$ is Fréchet differentiable and $\nabla g^{*}$ is uniformly continuous on bounded subsets.
Lemma 1.16. [Naraghirad \& Yao, 2013, Lemma 2.2]. Let $X$ be a Banach space, $r>0$ and $g: X \rightarrow \mathbb{R}$ be convex and uniformly convex on bounded subsets. Then

$$
g\left(\sum_{n=1}^{m} a_{n} u_{n}\right) \leq \sum_{n=1}^{m} a g\left(u_{n}\right)-a_{i} a_{j} \rho_{\varepsilon}\left(\left\|u_{i}-u_{j}\right\|\right)
$$

with $i, j \in\{1,2, \ldots, m\}, u_{n} \in B_{\varepsilon}=\{u \in X:\|u\| \leq \varepsilon\}$ and $a_{n} \in[0,1]$ such that $\sum_{n=1}^{m} a_{n}=1$, and the function $\rho_{\varepsilon}$ is defined as in Definition 1.11.

We denote by $F(S)=\{w \in \Omega: S w=w\}$ the set of fixed points of $S: \Omega \rightarrow \Omega$.
Definition 1.17. [Chang et al., 2014, Definition 2.10]. Let $X$ be a reflexive Banach space, $\Omega$ be a nonempty subset of $X, S: \Omega \rightarrow \Omega$ be a mapping and $D_{g}$ be the Bregman distance. Then
(1) $S$ is called a Bregman quasi-asymptotically nonexpansive mapping if $F(S) \neq \varnothing$ and there exists a real sequence $\left\{\delta_{n}\right\} \subset[1, \infty)$ with $\lim _{n \rightarrow \infty} \delta_{n}=1$ such that

$$
D_{g}\left(u, S^{n} v\right) \leq \delta_{n} D_{g}(u, v) \text { for all } v \in \Omega \text { and } u \in F(S) .
$$

(2) $S$ is called a Bregman totally quasi-asymptotically nonexpansive mapping if $F(S) \neq \varnothing$ and there exist nonnegative real sequences $\left\{\alpha_{n}\right\},\left\{\beta_{n}\right\}$ with $\lim _{n \rightarrow \infty} \alpha_{n}=\lim _{n \rightarrow \infty} \beta_{n}=0$ and a strictly increasing continuous function $\zeta: \mathbb{R}^{+} \rightarrow \mathbb{R}^{+}$with $\zeta(0)=0$ such that

$$
D_{g}\left(u, S^{n} v\right) \leq D_{g}(u, v)+\alpha_{n} \zeta\left(D_{g}(u, v)\right)+\beta_{n} \text { for all } v \in \Omega \text { and } u \in F(S) .
$$

(3) $S$ is called a Bregman firmly nonexpansive mapping if
$\langle\nabla g(S u)-\nabla g(S v), S u-S v\rangle \leq\langle\nabla g(u)-\nabla g(v), S u-S v\rangle$ for all $u, v \in \Omega$.
(4) $S$ is called a Bregman quasi-nonexpansive mapping if $F(S) \neq \varnothing$ and
$D_{g}(u, S v) \leq D_{g}(u, v)$ for all $v \in \Omega$ and $u \in F(S)$.
Remark 1.18. [Chang et al., 2014, p.42].
(1) If $S$ is a Bregman quasi-asymptotically nonexpansive mapping, then $S$ is a Bregman totally quasi-asymptotically nonexpansive mapping with $\zeta(\lambda)=\lambda$ for all $\lambda \geq 0$, $\alpha_{n}=\delta_{n}-1$ with $\delta_{n} \geq 1$ satisfying $\lim _{n \rightarrow \infty} \delta_{n}=1$ and $\beta_{n}=0$; but the converse is not true.
(2) If $S$ is a Bregman firmly nonexpansive mapping, then $S$ is a Bregman quasinonexpansive mapping.
Definition 1.19. [Zhu \& Huang, 2016, Definition 2.10]. Let $X$ be a Banach space, $\Omega$ be a nonempty subset of $X, S: \Omega \rightarrow \Omega$ be a mapping. Then
(1) $S$ is called closed if any sequence $\left\{u_{n}\right\}$ in $\Omega$ such that $\lim _{n \rightarrow \infty} u_{n}=u \in \Omega$ and $\lim _{n \rightarrow \infty} S u_{n}=v \in \Omega$, we have $S u=v$.
(2) $S$ is called uniformly asymptotically regular on $\Omega$ if for all bounded subset $U$ of $\Omega$ we have $\lim _{n \rightarrow \infty} \sup _{x \in U}\left\|S^{n+1} u-S^{n} u\right\|=0$.
Lemma 1.20. [Chang et al., 2014, Lemma 2.16]. Let $X$ be a real reflexive Banach space, $\Omega$ be a nonempty, closed and convex subset of $X, g: X \rightarrow(-\infty,+\infty]$ be a Legendre function which is totally convex on bounded subsets of $X, S: \Omega \rightarrow \Omega$ be a closed and Bregman totally quasiasymptotically nonexpansive mapping. Then $F(S)$ is convex and closed.

In order to slove (GMEP), we suppose that $f$ satisfies the following hypotheses:
(C1) $f(u, u)=0$ for all $u \in \Omega$.
(C2) $f(u, v)+f(v, u) \leq 0$ for all $u, v \in \Omega$.
(C3) $\limsup _{\lambda \rightarrow 0} f(\lambda w+(1-\lambda) u, v) \leq f(u, v)$ for all $u, v, w \in \Omega$,
(C4) For each $u \in \Omega, v \mapsto f(u, v)$ is convex and lower semi-continuous.
Definition 1.21. [Darvish, 2016, Definition 2.4]. Let $X$ be a real reflexive Banach space, $\Omega$ be a nonempty, convex and closed subset of $X$. Suppose that $f: \Omega \times \Omega \rightarrow \mathbb{R}$ satisfies (C1)-(C4), $\varphi: \Omega \rightarrow \mathbb{R}$ is convex and lower semi-continuous, $\psi: \Omega \rightarrow X^{*}$ is continuous monotone. The mixed resolvent of $f$ is the mapping $\operatorname{Res}_{f, \varphi, \varphi}^{g}: X \rightarrow 2^{\Omega}$ which is defined by

$$
\begin{aligned}
\operatorname{Res}_{f, \varphi, \psi}^{g}(u)=\{w \in \Omega: f(w, v)+ & \varphi(v)+\langle\psi(u), v-w\rangle \\
& +\langle\nabla f(w)-\nabla f(u), v-w\rangle \geq \varphi(w), \forall v \in \Omega\} .
\end{aligned}
$$

Note that if $g: X \rightarrow(-\infty,+\infty]$ is strongly coercive and Gâteaux differentiable, then $\operatorname{dom}\left(\operatorname{Res}_{f, \varphi, \psi}^{g}\right)=X$, see [Darvish, 2016, Lemma 2.7]. We find that the formula of the function $\operatorname{Res}_{f, \varphi, \psi}^{g}$ contains the term $\psi(u)$ for all $u \in X$. Since $\operatorname{dom} \psi=\Omega \subset X$, the value
$\psi(u)$ does not exist for all $u \in X \backslash \Omega$. Motivated by this confusion, we revise the formula of the function $\operatorname{Res}_{f, \varphi, \psi}^{g}$ by replacing the term $\psi(u), u \in X$ by $\psi(w), w \in \Omega$. This formula has been stated in (Ni \& Wen, 2018, Lemma 2.5), where $\operatorname{Res}_{f, \varphi, \psi}^{g}$ is denoted by $T_{r}^{G}$ as follows.

$$
\begin{align*}
\operatorname{Res}_{f, \varphi, \psi}^{g}(u)=\{w \in \Omega: f(w, v)+\varphi(v) & +\langle\psi(w), v-w\rangle \\
& +\langle\nabla f(w)-\nabla f(u), v-w\rangle \geq \varphi(w), \forall v \in \Omega\} . \tag{1.2}
\end{align*}
$$

The following lemma presents some properties of $\operatorname{Res}_{f, \varphi, \psi}^{g}$ which is defined by (1.2).
Lemma 1.22. [Ni \& Wen, 2018, Lemma 2.5]. Let $X$ be a real reflexive Banach space, $\Omega$ be a nonempty, closed and convex subset of $X, g: X \rightarrow \mathbb{R}$ be Legendre and $f: \Omega \times \Omega \rightarrow \mathbb{R}$ be a bifunctional satisfying (C1)-(C4). Then
(1) $\operatorname{Res}_{f,,, 4}^{s}$ is a single-valued and Bregman firmly nonexpansive mapping.
(2) $F\left(\operatorname{Res}_{f, \varphi, \psi, \psi}^{g}\right)=\operatorname{GMEP}(f, \varphi, \psi), \operatorname{GMEP}(f, \varphi, \psi)$ is convex and closed.
(3) For all $u \in X$ and $v \in F\left(\operatorname{Res}_{f, \varphi, \psi}^{g}\right)$, we have

$$
D_{g}\left(v, \operatorname{Res}_{f, \varphi, \psi}^{g}(u)\right)+D_{g}\left(\operatorname{Res}_{f, \varphi, \psi}^{g}(u), u\right) \leq D_{g}(v, u) .
$$

## 2. Main results

The following result shows the strong convergence of a hybrid iteration process for a generalized mixed equilibrium problem and a Bregman totally quasi-asymptotically nonexpansive mapping in reflexive Banach spaces.
Theorem 2.1. Let $X$ be a real reflexive Banach space, $\Omega$ be a nonempty, closed and convex subset of $X, g: X \rightarrow \mathbb{R}$ be Legendre, strongly coercive, bounded, totally convex and Fréchet differentiable on bounded subsets. Suppose that $f: \Omega \times \Omega \rightarrow \mathbb{R}$ satisfies (C1)(C4), $\varphi: \Omega \rightarrow \mathbb{R}$ is lower semi-continuous and convex, $\psi: \Omega \rightarrow X^{*}$ is continuous monotone, $S: \Omega \rightarrow \Omega$ is a closed, uniformly asymptotically regular and Bregman totally quasi-asymptotically nonexpansive mapping with $\left\{\alpha_{n}\right\},\left\{\beta_{n}\right\} \subset[0, \infty)$ satisfying $\lim _{n \rightarrow \infty} \alpha_{n}=\lim _{n \rightarrow \infty} \beta_{n}=0$ and a strictly increasing continuous function $\zeta: \mathbb{R}^{+} \rightarrow \mathbb{R}^{+}$with $\zeta(0)=0$ such that $\mathcal{F}=F(S) \cap \operatorname{GMEP}(f, \varphi, \psi)$ is bounded and nonempty. Let $\left\{z_{n}\right\}$ be a sequence generated by: $z_{1} \in \Omega, \Omega_{1}=\Omega$ and

$$
\left\{\begin{array}{l}
u_{n}=\nabla g^{*}\left(a_{n} \nabla g\left(z_{n}\right)+\left(1-a_{n}\right) \nabla g\left(S^{n} z_{n}\right)\right)  \tag{2.1}\\
v_{n} \in \Omega: f\left(v_{n}, v\right)+\varphi(v)+\left\langle\psi\left(v_{n}\right), v-v_{n}\right\rangle+\left\langle\nabla g\left(v_{n}\right)-\nabla g\left(z_{n}\right), v-v_{n}\right\rangle \geq \varphi\left(v_{n}\right), \forall v \in \Omega \\
w_{n}=\nabla g^{*}\left(b_{n} \nabla g\left(u_{n}\right)+\left(1-b_{n}\right) \nabla g\left(S^{n} v_{n}\right)\right) \\
\Omega_{n+1}=\left\{u \in \Omega_{n}: D_{g}\left(u, w_{n}\right) \leq D_{g}\left(u, z_{n}\right)+\gamma_{n}\right\} \\
z_{n+1}=P_{\Omega_{n+1}}^{g}\left(z_{1}\right), n \in \mathbb{N}^{*}
\end{array}\right.
$$

where $\gamma_{n}=\alpha_{n} \sup \left\{\zeta\left(D_{g}\left(u, z_{n}\right)\right): u \in \mathcal{F}\right\}+\beta_{n}$ and $\left\{a_{n}\right\},\left\{b_{n}\right\} \subset[0,1]$ such that $\lim _{n \rightarrow \infty} a_{n}=1$ and $\liminf _{n \rightarrow \infty} b_{n}\left(1-b_{n}\right)>0$. Then the sequence $\left\{z_{n}\right\}$ strongly converges to $p=P_{\mathcal{F}}^{g}\left(z_{1}\right)$.

Proof. We divide the proof of this theorem into six steps.
Step 1. We show that $P_{\mathcal{F}}^{g}\left(x_{1}\right)$ is well-defined. Indeed, it follows from Lemma 1.20 and Lemma 1.22 that $F(S)$ and $\operatorname{GMEP}(f, \varphi, \psi)$ are closed and convex. Therefore, by combining this with the assumption, we obtain that $\mathcal{F}=F(S) \cap \operatorname{GMEP}(f, \varphi, \psi)$ is a nonempty, closed and convex subset of $\Omega$. This fact ensures that $P_{\mathcal{F}}^{g}\left(z_{1}\right)$ is well-defined.
Step 2. We show that $P_{\Omega_{n+1}}^{g}\left(z_{1}\right)$ is well-defined. We first claim by mathematical induction that $\Omega_{n}$ is convex and closed for all $n \in \mathbb{N}^{*}$. Obviously, for $n=1$, we have $\Omega_{1}=\Omega$ is closed and convex. Now we suppose that $\Omega_{k}$ is convex and closed for some $k \in \mathbb{N}^{*}$. Then, by the definition of $\Omega_{n+1}$, we have

$$
\begin{equation*}
\Omega_{k+1}=\left\{u \in \Omega_{k}:\left\langle\nabla g\left(z_{k}\right), u-z_{k}\right\rangle-\left\langle\nabla g\left(w_{k}\right), u-w_{k}\right\rangle \leq \gamma_{k}-g\left(z_{k}\right)+g\left(w_{k}\right)\right\} . \tag{2.2}
\end{equation*}
$$

By combining (2.2) with the continuity of $\nabla g($.$) , we get that \Omega_{k+1}$ is convex and closed. Therefore, $\Omega_{n}$ is convex and closed for all $n \in \mathbb{N}^{*}$. Next, we will claim by mathematical induction that $\mathcal{F} \subset \Omega_{n}$ for all $n \in \mathbb{N}^{*}$. Obviously, we have $\mathcal{F} \subset \Omega=\Omega_{1}$. Now, we suppose that $\mathcal{F} \subset \Omega_{k}$ for some $k \in \mathbb{N}^{*}$. We will show that $\mathcal{F} \subset \Omega_{k+1}$. Indeed, for any $u \in \mathcal{F}$, we get $u \in \Omega_{k}$. By using Remark 1.4.(2), we have

$$
\begin{align*}
& D_{g}\left(u, u_{k}\right)=D_{g}\left(u, \nabla g^{*}\left(a_{k} \nabla g\left(z_{k}\right)+\left(1-a_{k}\right) \nabla g\left(S^{k} z_{k}\right)\right)\right) \leq a_{k} D_{g}\left(u, z_{k}\right)+\left(1-a_{k}\right) D_{g}\left(u, S^{k} z_{k}\right) \\
& \leq a_{k} D_{g}\left(u, z_{k}\right)+\left(1-a_{k}\right)\left[D_{g}\left(u, z_{k}\right)+\alpha_{k} \zeta\left(D_{g}\left(u, z_{k}\right)\right)+\beta_{k}\right] \\
& =D_{g}\left(u, z_{k}\right)+\left(1-a_{k}\right)\left[\alpha_{k} \zeta\left(D_{g}\left(u, z_{k}\right)\right)+\beta_{k}\right] \leq D_{g}\left(u, z_{k}\right)+\alpha_{k} \zeta\left(D_{g}\left(u, z_{k}\right)\right)+\beta_{k} . \tag{2.3}
\end{align*}
$$

Furthermore, by the definition of $v_{n}$ and Definition 1.21, we have $v_{n}=\operatorname{Res}_{f, q, \psi}^{g}\left(z_{n}\right)$. It follows from Remark 1.18 and Lemma 1.22 that $\operatorname{Res}_{f, \varphi, \psi}^{g}$ is a Bregman quasi-nonexpansive mapping. Therefore $D_{g}\left(u, v_{k}\right)=D_{g}\left(u, \operatorname{Res}_{f, \varphi, \psi}^{g}\left(z_{k}\right)\right) \leq D_{g}\left(u, z_{k}\right)$.
Next, by using Remark 1.4.(2), we obtain

$$
\begin{align*}
D_{g}\left(u, w_{k}\right) & =D_{g}\left(u, \nabla g^{*}\left(b_{n} \nabla g\left(u_{k}\right)+\left(1-b_{k}\right) \nabla g\left(S^{k} v_{k}\right)\right)\right) \leq b_{k} D_{g}\left(u, u_{k}\right)+\left(1-b_{k}\right) D_{g}\left(u, T^{k} v_{k}\right) \\
& \leq b_{k} D_{g}\left(u, u_{k}\right)+\left(1-b_{k}\right)\left[D_{g}\left(u, v_{k}\right)+\alpha_{k} \zeta\left(D_{g}\left(u, v_{k}\right)\right)+\beta_{k}\right] . \tag{2.5}
\end{align*}
$$

It follows from (2.4) and the strictly increasing property of $\zeta$ that $\zeta\left(D_{g}\left(u, v_{k}\right)\right)<\zeta\left(D_{g}\left(u, z_{k}\right)\right)$. Then, from (2.4), (2.5) becomes

$$
\begin{equation*}
D_{g}\left(u, w_{k}\right) \leq b_{k} D_{g}\left(u, u_{k}\right)+\left(1-b_{k}\right)\left[D_{g}\left(u, z_{k}\right)+\alpha_{k} \zeta\left(D_{g}\left(u, z_{k}\right)\right)+\beta_{k}\right] . \tag{2.6}
\end{equation*}
$$

By substituting (2.3) into (2.6), we have

$$
\begin{align*}
D_{g}\left(u, w_{k}\right) & \leq b_{k}\left[D_{g}\left(u, z_{k}\right)+\alpha_{k} \zeta\left(D_{g}\left(u, z_{k}\right)\right)+\beta_{k}\right]+\left(1-b_{k}\right)\left[D_{g}\left(u, z_{k}\right)+\alpha_{k} \zeta\left(D_{g}\left(u, z_{k}\right)\right)+\beta_{k}\right] \\
& =D_{g}\left(u, z_{k}\right)+\alpha_{k} \zeta\left(D_{g}\left(u, z_{k}\right)\right)+\beta_{k} \leq D_{g}\left(u, z_{k}\right)+\gamma_{k} . \tag{2.7}
\end{align*}
$$

This implies that $u \in \Omega_{k+1}$ and hence $\mathcal{F} \subset \Omega_{k+1}$. Therefore, we conclude that $\mathcal{F} \subset \Omega_{n}$ for all $n \in \mathbb{N}^{*}$. By the assumption $\mathcal{F} \neq \varnothing$, we obtain $\Omega_{n+1} \neq \varnothing$. Therefore, we find that $P_{\Omega_{n+1}}^{g}\left(z_{1}\right)$ is well-defined.
Step 3. We show that $\left\{D_{g}\left(z_{n}, z_{1}\right)\right\},\left\{z_{n}\right\}$ are bounded and $\lim _{n \rightarrow \infty} D_{g}\left(z_{n}, z_{1}\right)$ exists. Indeed, since $z_{n}=P_{\Omega_{n}}^{g}\left(z_{1}\right)$, by Proposition 1.9, we get $D_{g}\left(y, z_{n}\right)+D_{g}\left(z_{n}, z_{1}\right) \leq D_{g}\left(y, z_{1}\right), \forall y \in \Omega_{n}$.

Let $u \in \mathcal{F}$. Since $\mathcal{F} \subset \Omega_{n}$, we get $u \in \Omega_{n}$. By choosing $y=u$ in (2.8), we obtain

$$
\begin{equation*}
D_{g}\left(u, z_{n}\right)+D_{g}\left(z_{n}, z_{1}\right) \leq D_{g}\left(u, z_{1}\right) \tag{2.9}
\end{equation*}
$$

This implies that $D_{g}\left(z_{n}, z_{1}\right) \leq D_{g}\left(u, z_{1}\right)-D_{g}\left(u, z_{n}\right) \leq D_{g}\left(u, z_{1}\right)$. Therefore, $\left\{D_{g}\left(z_{n}, z_{1}\right)\right\}$ is bounded. Then, by Proposition 1.10(1), we conclude that the sequence $\left\{z_{n}\right\}$ is bounded. Furthermore, we have $z_{n+1}=P_{\Omega_{n+1}}^{g}\left(z_{1}\right) \in \Omega_{n+1} \subset \Omega_{n}$. By choosing $y=z_{n+1}$ in (2.8), we get $D_{g}\left(z_{n+1}, z_{n}\right)+D_{g}\left(z_{n}, z_{1}\right) \leq D_{g}\left(z_{n+1}, z_{1}\right)$. This implies that $D_{g}\left(z_{n}, z_{1}\right) \leq D_{g}\left(z_{n+1}, z_{1}\right)$. This proves that $\left\{D_{g}\left(z_{n}, z_{1}\right)\right\}$ is a nondecreasing sequence. By combining this with the boundedness of the sequence $\left\{D_{g}\left(z_{n}, z_{1}\right)\right\}$, we conclude that the limit $\lim _{n \rightarrow \infty} D_{g}\left(z_{n}, z_{1}\right)$ exsits.
Step 4. We show that $\lim _{n \rightarrow \infty} z_{n}=p \in \Omega$ and $\lim _{n \rightarrow \infty}\left\|z_{n+1}-z_{n}\right\|=0$. Indeed, for $m>n$, we have $z_{m}=P_{\Omega_{m}}^{g}\left(z_{1}\right) \in \Omega_{m} \subset \Omega_{n}$. By choosing $y=z_{m}$ in (2.8), we get

$$
\begin{equation*}
D_{g}\left(z_{m}, z_{n}\right)+D_{g}\left(z_{n}, z_{1}\right) \leq D_{g}\left(z_{m}, z_{1}\right) . \tag{2.10}
\end{equation*}
$$

This imples that $0 \leq D_{g}\left(z_{m}, z_{n}\right) \leq D_{g}\left(z_{m}, z_{1}\right)-D_{g}\left(z_{n}, z_{1}\right)$.
Taking the limit (2.10) as $m, n \rightarrow \infty$ and using the existence of $\lim _{n \rightarrow \infty} D_{g}\left(z_{n}, z_{1}\right)$, we get

$$
\begin{equation*}
\lim _{n, m \rightarrow \infty} D_{g}\left(z_{m}, z_{n}\right)=0 . \tag{2.11}
\end{equation*}
$$

By combining (2.11) with the boundedness of the sequence $\left\{z_{n}\right\}$, by Proposition 1.8, we have $\lim _{n, m \rightarrow \infty}\left\|z_{n}-z_{m}\right\|=0$.

This proves that $\left\{z_{n}\right\}$ is a Cauchy sequence in $\Omega$. Since $X$ is a Banach space and $\Omega$ is a closed subset of $X$, there exists $p \in \Omega$ such that $\lim _{n \rightarrow \infty} z_{n}=p$. Moreover, by choosing $m=n+1$ in (2.11) and (2.12), we obtain $\lim _{n \rightarrow \infty} D_{g}\left(z_{n+1}, z_{n}\right)=0$
and $\lim _{n \rightarrow \infty}\left\|z_{n+1}-z_{n}\right\|=0$.
Step 5. We show that $p \in \mathcal{F}$. Indeed, since $z_{n+1}=P_{\Omega_{n+1}}^{g}\left(z_{1}\right) \in \Omega_{n+1} \subset \Omega_{n}$, we have

$$
\begin{equation*}
D_{g}\left(z_{n+1}, w_{n}\right) \leq D_{g}\left(z_{n+1}, z_{n}\right)+\gamma_{n} . \tag{2.15}
\end{equation*}
$$

It follows from (2.9) and the boundedness of $\left\{D_{g}\left(z_{n}, z_{1}\right)\right\}$ that $\left\{D_{g}\left(u, z_{n}\right)\right\}$ is bounded for any $u \in \mathcal{F}$. Then, by using $\lim _{n \rightarrow \infty} \alpha_{n}=\lim _{n \rightarrow \infty} \beta_{n}=0$, we find that $\lim _{n \rightarrow \infty} \gamma_{n}=0$.
Therefore, from (2.13), (2.15) and (2.16), we conclude that $\lim _{n \rightarrow \infty} D_{g}\left(z_{n+1}, w_{n}\right)=0$.
Let $u \in \mathcal{F}$. By (2.9) and the boundednees of $\left\{D_{g}\left(z_{n}, z_{1}\right)\right\}$, we obtain that $\left\{D_{g}\left(u, z_{n}\right)\right\}$ is bounded. By combining this with (2.7), we conclude that $\left\{D_{g}\left(u, w_{n}\right)\right\}$ is bounded. Furthermore, by Proposition 1.15, we find that $g^{*}$ is bounded on bounded sets. Then $\nabla g^{*}$ is bounded on bounded sets. It follows from Proposition 1.10(2) that $\left\{w_{n}\right\}$ is bounded. By combining this with (2.17), from Proposition 1.8, we have $\lim _{n \rightarrow \infty}\left\|z_{n+1}-w_{n}\right\|=0$.

It follows from (2.14) and (2.18) that $\lim _{n \rightarrow \infty}\left\|z_{n}-w_{n}\right\|=0$.
Since $g$ is uniformly Fréchet differentiable, $g$ is uniformly continuous. Then, from (2.19) we get $\lim _{n \rightarrow \infty}\left\|g\left(z_{n}\right)-g\left(w_{n}\right)\right\|=0$.

Since $g$ is uniformly Fréchet differentiable, $\nabla g$ is uniformly continuous on bounded subsets of $X$. Therefore, from (2.19), we have $\lim _{n \rightarrow \infty}\left\|\nabla g\left(z_{n}\right)-\nabla g\left(w_{n}\right)\right\|=0$.
For any $u \in \mathcal{F}$, by using similar arguments as in the proofs of (2.3) and (2.4), we obtain

$$
\begin{equation*}
D_{g}\left(u, u_{n}\right) \leq D_{g}\left(u, z_{n}\right)+\alpha_{n} \zeta\left(D_{g}\left(u, z_{n}\right)\right)+\beta_{n} \tag{2.22}
\end{equation*}
$$

and $D_{g}\left(u, v_{n}\right) \leq D_{g}\left(u, z_{n}\right)$.
By combining (2.22) with the boundedness of $\left\{D_{g}\left(u, x_{n}\right)\right\}$, we get that $\left\{D_{g}\left(u, u_{n}\right)\right\}$ is bounded. By Proposition 1.10(2), we get that $\left\{u_{n}\right\}$ is bounded. It follows from (2.23) and the boundedness of $\left\{D_{g}\left(u, x_{n}\right)\right\}$ that $\left\{D_{g}\left(u, v_{n}\right)\right\}$ is bounded. Since $\left\{D_{g}\left(u, v_{n}\right)\right\}$ is bounded and $D_{g}\left(u, S^{n} v_{n}\right) \leq D_{g}\left(u, v_{n}\right)+\alpha_{n} \zeta\left(D_{g} u, v_{n}\right)+\beta_{n}$, we find that $\left\{D_{g}\left(u, S^{n} v_{n}\right)\right\}$ is bounded. Thus, from Proposition 1.10(2), we get that $\left\{S^{n} v_{n}\right\}$ is bounded. Since $\left\{u_{n}\right\},\left\{S^{n} v_{n}\right\}$ are bounded and $\nabla g$ is bounded on bounded subsets of $X$, we conclude that $\left\{\nabla g\left(u_{n}\right)\right\}$ and $\left\{\nabla g\left(S^{n} v_{n}\right)\right\} \quad$ are bounded. Put $\quad r=\sup _{n \in \mathbb{N}^{*}} \max \left\{\left\|\nabla g\left(u_{n}\right)\right\|,\left\|\nabla g\left(S^{n} v_{n}\right)\right\|\right\}$. Therefore, $\nabla g\left(u_{n}\right), \nabla g\left(S^{n} v_{n}\right) \in B_{\varepsilon}=\left\{u \in X^{*}:\|u\| \leq \varepsilon\right\}$. By Proposition 1.14, we find that $g^{*}$ is uniformly convex on bounded subsets of $X^{*}$. Therefore, by Lemma 1.16, we have

$$
\begin{aligned}
& g^{*}\left(b_{n} \nabla g\left(u_{n}\right)+\left(1-b_{n}\right) \nabla g\left(S^{n} v_{n}\right)\right) \\
& \leq b_{n} g^{*}\left(\nabla g\left(u_{n}\right)\right)+\left(1-b_{n}\right) g^{*}\left(\nabla g\left(S^{n} v_{n}\right)\right)-b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right),
\end{aligned}
$$

where $\rho_{\varepsilon}$ is defined as in Definition 1.11. By using Remark 1.4.(1) and the definition of $V_{f}$, we get

$$
D_{g}\left(u, w_{n}\right)=D_{g}\left(u, \nabla g^{*}\left(b_{n} \nabla g\left(u_{n}\right)+\left(1-b_{n}\right) \nabla g\left(S^{n} v_{n}\right)\right)\right)=V_{g}\left(u, b_{n} \nabla g\left(u_{n}\right)+\left(1-b_{n}\right) \nabla g\left(S^{n} v_{n}\right)\right)
$$

$$
\begin{align*}
&= g(u)-\left\langle b_{n} \nabla g\left(u_{n}\right)+\left(1-b_{n}\right) \nabla g\left(S^{n} v_{n}\right), u\right\rangle+g^{*}\left(b_{n} \nabla g\left(u_{n}\right)+\left(1-b_{n}\right) \nabla g\left(S^{n} v_{n}\right)\right) \\
&= g(u)-\left\langle b_{n} \nabla g\left(u_{n}\right)+\left(1-b_{n}\right) \nabla g\left(S^{n} v_{n}\right), u\right\rangle \\
&+b_{n} g^{*}\left(\nabla g\left(u_{n}\right)\right)+\left(1-b_{n}\right) g^{*}\left(\nabla g\left(S^{n} v_{n}\right)\right)-b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right) \\
&= b_{n}\left[g(u)-\left\langle\nabla g\left(u_{n}\right), u\right\rangle+g^{*}\left(\nabla g\left(u_{n}\right)\right)\right]+\left(1-b_{n}\right)\left[g(u)-\left\langle\nabla g\left(S^{n} v_{n}\right), u\right\rangle+g^{*}\left(\nabla g\left(S^{n} v_{n}\right)\right)\right] \\
& \quad-b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right) \\
&= b_{n} V_{g}\left(u, \nabla g\left(u_{n}\right)\right)+\left(1-b_{n}\right) V_{g}\left(u, \nabla g\left(S^{n} v_{n}\right)\right)-b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right) \\
&= b_{n} D_{g}\left(u, \nabla g^{*}\left(\nabla g\left(u_{n}\right)\right)\right)+\left(1-b_{n}\right) D_{g}\left(u, \nabla g^{*}\left(\nabla g\left(S^{n} v_{n}\right)\right)\right) \\
& \quad \quad-b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right) \\
&= b_{n} D_{g}\left(u, u_{n}\right)+\left(1-b_{n}\right) D_{g}\left(u, S^{n} v_{n}\right)-b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right) \\
& \leq b_{n} D_{g}\left(u, u_{n}\right)+\left(1-b_{n}\right)\left[D_{g}\left(u, v_{n}\right)+\alpha_{n} \zeta\left(D_{g}\left(u, v_{n}\right)\right)+\beta_{n}\right] \\
& \quad-b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right) . \tag{2.24}
\end{align*}
$$

Thus, by combining (2.23), (2.24) and the the strictly increasing property of $\zeta$, we get

$$
\begin{align*}
D_{g}\left(u, w_{n}\right) \leq b_{n} D_{g}\left(u, u_{n}\right)+ & \left(1-b_{n}\right)\left[D_{g}\left(u, z_{n}\right)+\alpha_{n} \zeta\left(D_{g}\left(u, z_{n}\right)\right)+\beta_{n}\right] \\
& -b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right) . \tag{2.25}
\end{align*}
$$

By (2.22) and (2.25), we get $D_{g}\left(u, w_{n}\right) \leq D_{g}\left(u, z_{n}\right)+\gamma_{n}-b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right)$.
This implies that $b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right) \leq D_{g}\left(u, z_{n}\right)-D_{g}\left(u, w_{n}\right)+\gamma_{n}$.
Furthermore, by the property of the function $D_{g}$, we have

$$
\begin{align*}
& \left|D_{g}\left(u, z_{n}\right)-D_{g}\left(u, w_{n}\right)\right|=\left|-D\left(z_{n}, w_{n}\right)+\left\langle\nabla g\left(w_{n}\right)-\nabla g\left(z_{n}\right), u-z_{n}\right\rangle\right| \\
& \leq\left|g\left(z_{n}\right)-g\left(w_{n}\right)\right|+\left\|\nabla g\left(w_{n}\right)\right\| \cdot\left\|z_{n}-w_{n}\right\|+\left\|u-z_{n}\right\| \cdot\left\|\nabla g\left(w_{n}\right)-\nabla g\left(z_{n}\right)\right\| . \tag{2.27}
\end{align*}
$$

Then from (2.19), (2.20), (2.21) and (2.27), we get $\lim _{n \rightarrow \infty}\left|D_{g}\left(u, z_{n}\right)-D_{g}\left(u, w_{n}\right)\right|=0$.
By (2.16), (2.26) and (2.28) that $\lim _{n \rightarrow \infty} b_{n}\left(1-b_{n}\right) \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right)=0$.
By (2.29) and $\liminf _{n \rightarrow \infty} b_{n}\left(1-b_{n}\right)>0$, we have $\lim _{n \rightarrow \infty} \rho_{\varepsilon}\left(\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|\right)=0$.
By combining (2.30) and the property of $\rho_{\varepsilon}$, we get $\lim _{n \rightarrow \infty}\left\|\nabla g\left(u_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|=0$.
It follows from the assumptions of $g$ and Proposition 1.15 that $\nabla g^{*}$ is uniformly continuous on bounded subsets. Thus, by (2.31), we get $\lim _{n \rightarrow \infty}\left\|u_{n}-S^{n} v_{n}\right\|=0$.

Furthermore, by $\nabla g=\left(\nabla g^{*}\right)^{-1}$ and the definition of $u_{n}$, we obtain

$$
\begin{equation*}
\nabla g\left(u_{n}\right)=\nabla g\left(\nabla g^{*}\left(a_{n} \nabla g\left(z_{n}\right)+\left(1-a_{n}\right) \nabla g\left(S^{n} z_{n}\right)\right)\right)=a_{n} \nabla g\left(z_{n}\right)+\left(1-a_{n}\right) \nabla g\left(S^{n} z_{n}\right) \text {. This } \tag{2.33}
\end{equation*}
$$

leads to $\left\|\nabla g\left(u_{n}\right)-\nabla g\left(z_{n}\right)\right\|=\left(1-a_{n}\right)\left\|\nabla g\left(S^{n} z_{n}\right)-\nabla g\left(z_{n}\right)\right\|$.
By $\lim _{n \rightarrow \infty} a_{n}=1$, the boundedness of $\left\{z_{n}\right\}$, (2.33), we get $\lim _{n \rightarrow \infty} \mid \nabla g\left(u_{n}\right)-\nabla g\left(z_{n}\right) \|=0$.
Since $\nabla g^{*}$ is uniformly continuous on bounded subsets, from (2.34), we have

$$
\begin{equation*}
\lim _{n \rightarrow \infty}\left\|u_{n}-z_{n}\right\|=0 \tag{2.35}
\end{equation*}
$$

By combining (2.32) and (2.35), we obtain $\lim _{n \rightarrow \infty}\left\|z_{n}-S^{n} v_{n}\right\|=0$.
It follows from (2.36) and $\lim _{n \rightarrow \infty} z_{n}=p$ that $\lim _{n \rightarrow \infty} S^{n} v_{n}=p$. Thus, by combining this with the asymptotically regular property of $S$ and $\left\|S^{n+1} v_{n}-p\right\| \leq\left\|S^{n+1} v_{n}-S^{n} v_{n}\right\|+\left\|S^{n} v_{n}-p\right\|$, we conclude that $\lim _{n \rightarrow \infty} S^{n+1} v_{n}=p$. This leads to $\lim _{n \rightarrow \infty} S\left(S^{n} v_{n}\right)=\lim _{n \rightarrow \infty} S^{n+1} v_{n}=p$. Since $S$ is closed, we conclude that $S p=p$ and hence $p \in F(S)$.

Next, we will prove that $p \in \operatorname{GMEP}(f, \varphi, \psi)$. Since $v_{n}=\operatorname{Res}_{f, \varphi, \psi}^{g}\left(z_{n}\right)$, we obtain

$$
\begin{equation*}
f\left(v_{n}, v\right)+\varphi(v)+\left\langle\psi\left(v_{n}\right), v-v_{n}\right\rangle+\left\langle\nabla g\left(v_{n}\right)-\nabla g\left(z_{n}\right), v-v_{n}\right\rangle \geq \varphi\left(v_{n}\right) \text { for all } v \in \Omega . \tag{2.37}
\end{equation*}
$$

Then, from the condition $\left(C_{2}\right)$ and (2.37), we have

$$
\begin{equation*}
f\left(v, v_{n}\right) \leq-f\left(v_{n}, v\right) \leq\left\langle\psi\left(v_{n}\right), v-v_{n}\right\rangle+\left\langle\nabla g\left(v_{n}\right)-\nabla g\left(z_{n}\right), v-v_{n}\right\rangle+\varphi(v)-\varphi\left(v_{n}\right) . \tag{2.38}
\end{equation*}
$$

Furthermore, since $g$ and $\nabla g$ are uniformly continuous on bounded subsets of $X$, by (2.36), we get $\lim _{n \rightarrow \infty}\left\|g\left(z_{n}\right)-g\left(S^{n} v_{n}\right)\right\|=\lim _{n \rightarrow \infty}\left\|\nabla g\left(z_{n}\right)-\nabla g\left(S^{n} v_{n}\right)\right\|=0$.

We have $\left|D_{g}\left(u, z_{n}\right)-D_{g}\left(u, S^{n} v_{n}\right)\right|=\left|-D\left(z_{n}, S^{n} v_{n}\right)+\left\langle\nabla g\left(S^{n} v_{n}\right)-\nabla g\left(z_{n}\right), u-z_{n}\right\rangle\right|$
$\leq\left|g\left(z_{n}\right)-g\left(S^{n} v_{n}\right)\right|+\left\|\nabla g\left(S^{n} v_{n}\right)\right\| \cdot\left\|z_{n}-S^{n} v_{n}\right\|+\left\|u-z_{n}\right\| \cdot\left\|\nabla g\left(S^{n} v_{n}\right)-\nabla g\left(z_{n}\right)\right\|$.
By (2.36), (2.39) and (2.40), we get that $\lim _{n \rightarrow \infty}\left|D_{g}\left(u, z_{n}\right)-D_{g}\left(u, S^{n} v_{n}\right)\right|=0$.
For $u \in \mathcal{F}$, by Lemma 1.22 and $v_{n}=\operatorname{Res}_{f, q, \psi}^{g}\left(z_{n}\right)$, we find that

$$
\begin{equation*}
D_{g}\left(v_{n}, z_{n}\right) \leq D_{g}\left(u, z_{n}\right)-D_{g}\left(u, v_{n}\right) \leq D_{g}\left(u, z_{n}\right)-D_{g}\left(u, S^{n} v_{n}\right)+\alpha_{n} \zeta\left(D_{g}\left(u, v_{n}\right)\right)+\beta_{n} . \tag{2.42}
\end{equation*}
$$

It follows from (2.41), (2.42) and $\lim _{n \rightarrow \infty} \alpha_{n}=\lim _{n \rightarrow \infty} \beta_{n}=0$ that $\lim _{n \rightarrow \infty} D_{g}\left(v_{n}, z_{n}\right)=0$. Since $\left\{z_{n}\right\}$ is bounded, by Proposition 1.8, we have $\lim _{n \rightarrow \infty}\left\|v_{n}-z_{n}\right\|=0$. Since $\nabla g$ is uniformly continuous on bounded subsets, we get $\lim _{n \rightarrow \infty}\left\|\nabla g\left(z_{n}\right)-\nabla g\left(v_{n}\right)\right\|=0$. Therefore, by using (2.38), the lower semi-continuous property of $\varphi$, the lower semi-continuous property in the second variable of $f$ and the continuous property of $\psi$, we have

$$
\begin{equation*}
f(v, p) \leq\langle\psi(p), v-p\rangle+\varphi(v)-\varphi(p) \tag{2.43}
\end{equation*}
$$

and hence $f(v, p)+\langle\psi(p), p-y\rangle+\varphi(p)-\varphi(v) \leq 0$ for all $v \in \Omega$.
For all $t \in(0,1]$, put $v_{t}=t v+(1-t) p$. Since $v, p \in \Omega$ and $\Omega$ is convex, we have $v_{t} \in \Omega$. Thus, replacing $v$ by $v_{t}$ in (2.43), we get $f\left(v_{t}, p\right)+\left\langle\psi(p), p-v_{t}\right\rangle+\varphi(p)-\varphi\left(v_{t}\right) \leq 0$.

Then, by using the condition $\left(C_{1}\right)$, the convexity in the second variable of $f$, the convexity of $\varphi$ and (2.44), we have

$$
0=f\left(v_{t}, v_{t}\right)=f\left(v_{t}, v_{t}\right)+\left\langle\psi(p), v_{t}-v_{t}\right\rangle+\varphi\left(v_{t}\right)-\varphi\left(v_{t}\right)
$$

$$
\begin{aligned}
& \leq t f\left(v_{t}, v\right)+(1-t) f\left(v_{t}, p\right)+t\left\langle\psi(p), v-v_{t}\right\rangle+(1-t)\left\langle\psi(p), p-v_{t}\right\rangle+t \varphi(v)+(1-t) \varphi(p)-\varphi\left(v_{t}\right) \\
& =t\left[f\left(v_{t}, v\right)+\left\langle\psi(p), v-v_{t}\right\rangle+\varphi(v)-\varphi\left(v_{t}\right)\right]+(1-t)\left[f\left(v_{t}, p\right)+\left\langle\psi(p), p-v_{t}\right\rangle+\varphi(p)-\varphi\left(v_{t}\right)\right] \\
& \leq t\left[f\left(v_{t}, v\right)+\left\langle\psi(p), y-v_{t}\right\rangle+\varphi(v)-\varphi\left(v_{t}\right)\right] .
\end{aligned}
$$

This leads to $f\left(v_{t}, v\right)+\left\langle\psi(p), v-v_{t}\right\rangle+\varphi(v)-\varphi\left(v_{t}\right) \geq 0$ by $t \in(0,1]$. Letting $t \rightarrow 0^{+}$ and using the condition $\left(C_{3}\right.$ ), we have $f(p, v)+\langle\psi(p), y-p\rangle+\varphi(v)-\varphi(p) \geq 0$. This proves that $p \in \operatorname{GMEP}(f, \varphi, \psi)$. Therefore, $p \in \mathcal{F}=F(S) \cap \operatorname{GMEP}(f, \varphi, \psi)$.
Step 6. We show that $p=P_{\mathcal{F}}^{g}\left(z_{1}\right)$. Indeed, since $z_{n+1}=P_{\Omega_{n+1}}^{g}\left(z_{1}\right)$, by Proposition 1.9, we have $\left\langle\nabla g\left(z_{1}\right)-\nabla g\left(z_{n+1}\right), z_{n+1}-v\right\rangle \geq 0$ for all $v \in \Omega_{n+1}$. Let $u \in \mathcal{F}$. Since $\mathcal{F} \subset \Omega_{n+1}$, we get $u \in \Omega_{n+1}$. By choosing $v=u$ in the above inequality, we get $\left\langle\nabla g\left(z_{1}\right)-\nabla g\left(z_{n+1}\right), z_{n+1}-u\right\rangle \geq 0$. Taking $n \rightarrow \infty$, using $\lim _{n \rightarrow \infty} z_{n}=p$ and the uniform continuous on bounded subsets of $\nabla g$, we have $\left\langle\nabla g\left(z_{1}\right)-\nabla g(p), p-u\right\rangle \geq 0$ for all $u \in \mathcal{F}$. By Proposition 1.9, we find that $p=P_{\mathcal{F}}^{g}\left(z_{1}\right)$.
Remark 2.2. (1) Theorem 2.1 is an extension of [Alizadeh \& Moradlou, 2016, Theorem 3.1] from a generalized hybrid mapping in Hilbert spaces to a Bregman totally quasiasymptotically nonexpansive mapping, and from an equilibrium problem to a generalized mixed equilibrium problem in reflexive Banach spaces.
(2) Since [Alizadeh \& Moradlou, 2016, Theorem 3.1] is an extension of [Tada \& Takahashi, 2007, Theorem 3.1], Theorem 2.1 is also an extension of [Tada \& Takahashi, 2007, Theorem 3.1].
(3) By Remark 1.8(2), we conclude that the conclusion of Theorem 2.1 holds when $S$ is a Bregman quasi-asymptotically nonexpansive mapping.

Finally, an example is given to illustrate for the proposed iteration.
Example 2.3. Let $X=\mathbb{R}, \Omega=[0,0.9], g(x)=u^{2} \quad$ for all $x \in \mathbb{R}$, and $S(u)=u^{2}$, $\varphi(u)=10 u^{2}, \psi(u)=2 u, f(u, v)=-9 u^{2}+4 u v+5 v^{2}$ for all $u, v \in \Omega$. Then
(1) By calculating, we get $\nabla g(u)=2 u, g^{*}(w)=\frac{w^{2}}{4}, \nabla g^{*}(w)=\frac{w}{2}$ for all $u, w \in \mathbb{R}$.
(2) For all $u, v \in \mathbb{R}$, we have $D_{g}(u, v)=u^{2}-v^{2}-2 v(u-v)=(u-v)^{2}$.
(3) We have $F(S)=\{0\}$. Therefore, for $w \in F(S)$ and $u \in \Omega$, we obtain

$$
D_{g}\left(w, S^{n} u\right)=\left(0-S^{n} u\right)^{2}=(u)^{2^{n+1}} \leq u^{2}=D_{g}(0, u)=D_{g}(w, u) .
$$

This proves that $S$ is a Bregman totally quasi-asymptotically nonexpansive mapping with $\alpha_{n}=\beta_{n}=0$ for all $n \in \mathbb{N}^{*}$.
(4) By directly checking, we find that $f$ satisfies the conditions $\left(C_{1}\right)-\left(C_{4}\right)$.
(5) We find the formula of $w=\operatorname{Res}_{f, q, \psi}^{g}(u)$ for $u \in X, w \in \Omega$ as in (1.2). Indeed, $w=\operatorname{Res}_{f, q, \psi}^{g}(u)$ if $f(w, v)+\varphi(v)+\langle\psi(w), v-w\rangle+\langle\nabla g(w)-\nabla g(u), v-w\rangle \geq \varphi(w), v \in \Omega$. (2.45)
By substituting $f, \varphi, \psi, \nabla g$ into (2.45) and by directly calculating, we get

$$
15 v^{2}+(8 w-2 u) v+2 u w-23 w^{2} \geq 0
$$

Put $h(v)=15 v^{2}+(8 w-2 u) v+2 u w-23 w^{2}$ for all $v \in \Omega$. Then $h(v)$ is a quadratic function and $\Delta=(38 w-2 u)^{2}$. We consider the following cases.

Case 1. $\Delta>0$. Then the equation $h(v)=0$ has two solutions: $v_{1}=w \in \Omega$ and $v_{2}=\frac{-23 w+2 u}{15}$. In order to $h(v) \geq 0$ for all $v \in \Omega$, we have following two cases:

Case 1.1. $v_{1}=0.9$ and $v_{1}<v_{2}$. Then $w=v_{1}=0.9, v_{2}=\frac{-20.7+2 u}{15}>0.9$, hence $u>17.1$.
Case 1.2. $v_{1}=0$ and $v_{2}<v_{1}$. Then $w=v_{1}=0$ and $v_{2}=\frac{2 u}{15}<0$. This leads to $u<0$.
Case 2. $\Delta \leq 0$. Then $w=\frac{u}{19}$ and $h(v) \geq 0$ for all $v \in \Omega$. Since $w \in \Omega$, we have $0 \leq \frac{u}{19} \leq 0.9 \quad$ and hence $\quad 0 \leq u \leq 17.1$. Therefore, $\operatorname{Res}_{f, \varphi, \psi}^{g}(u)=w=0 \quad$ if $\quad u<0$, $\operatorname{Res}_{f, \varphi, \psi}^{g}(u)=w=\frac{u}{19}$ if $0 \leq u \leq 17.1$ and $\operatorname{Res}_{f, \varphi, \psi}^{g}(u)=w=0.9$ if $u>17.1$.

By the above, all assumptions in Theorem 2.1 are satisfied with the given functions $f, \varphi, \psi, T$. Therefore, by Theorem 2.1, the sequence $\left\{z_{n}\right\}$ which is defined by (2.1) converges to $0 \in \mathcal{F}=F(S) \cap \operatorname{GMEP}(f, \varphi, \psi)$. Next, by choosing $a_{n}=\frac{n}{n+2}, b_{n}=\frac{n+1}{3 n+2}$ for all $n \in \mathbb{N}^{*}$, and $z_{1}=0.5 \in \Omega$, we have $P_{\mathcal{F}}^{g}\left(z_{1}\right)=\{0\}$. The sequence (2.1) becomes

$$
\left\{\begin{array}{l}
u_{n}=\frac{n}{n+2} z_{n}+\frac{2}{n+2}\left(z_{n}\right)^{2^{n}}, v_{n}=\frac{z_{n}}{19}  \tag{2.46}\\
w_{n}=\frac{n+1}{3 n+2} u_{n}+\frac{2 n+1}{3 n+2}\left(v_{n}\right)^{2^{n}}, z_{n+1}=\frac{z_{n}+w_{n}}{2}
\end{array}\right.
$$

The convergence of iteration (2.46) is presented by the following figure.

Figure 1. The convergence of the sequence (2.46) to 0

## 3. Conclusion

In this paper, a hybrid iterative method is proposed for finding common elements of the solution set of a generalized mixed equilibrium problem and the fixed point set of a Bregman totally quasi-asymptotically nonexpansive mapping. After that, a strong convergence result for the proposed iteration is proved in reflexive Banach spaces. This result is an improvement of the main results in (Alizadeh \& Moradlou, 2016) and (Tada \& Takahashi, 2007) from a generalized hybrid mapping, a nonexpansive mapping and an equilibrium problem in Hilbert spaces to a Bregman totally quasi-asymptotically nonexpansive mapping and a generalized mixed equilibrium problem in reflexive Banach spaces. As application, we obtain the convergence result for a generalized mixed equilibrium problem and a Bregman quasiasymptotically nonexpansive mapping in reflexive Banach spaces. Moreover, we give a numerical example to illustrate for the proposed iterative method.

## TÓM TȦT

Mục đich của bài báo là kết hợp khoảng cách Bregman với phuơng pháp chiếu thu hẹp để giới thiệu một dãy lặp lai ghép mói cho bài toán cân bằng hỗn họp tổng quát và ánh xạ tựa tiệm cận không giãn hoàn toàn Bregman. Sau đó, với nhũng điều kiện thích hợp, chúng tôi chúng minh rằng dãy lặp đurợc đề xuất hội tụ mạnh đến hình chiếu Bregman của điểm xuất phát lên giao của tập nghiệm bài toán cân bằng hỗn họp tổng quát và tập điểm bất động của ánh xa tựa tiệm cận không giãn hoàn toàn Bregman trong không gian Banach phản xạ. Định lí này cải tiến kết quả trong (Alizadeh \& Moradlou, 2016) tù ánh xạ lai ghép tổng quát và bài toán cân bằng trong không gian Hilbert sang ánh xạ tưa tiệm cận không giãn hoàn toàn Bregman và bài toán cân bằng hỗn họp tổng quát trong không gian Banach phản xạ. Kết quả đurợc áp dụng cho bài toán cân bằng hỗn họp tổng quát và ánh xa tựa tiệm cận không giãn Bregman trong không gian Banach phản xạ. Đồng thời, một ví dụ được đưa ra để minh họa cho dãy lặp được đề xuất.

Từ khóa: ánh xạ tựa tiệm cận không giãn hoàn toàn Bregman; bài toán cân bằng hỗn hợp tổng quát; dãy lặp lai ghép; không gian Banach phản xạ
